This special issue of the Journal of Universal Computer Science (J.UCS) contains a selection of articles presented at the Fourth International Conference on Computability and Complexity in Analysis (CCA), held in Siena, Italy, June 16-18, 2007. This conference is the fourteenth event in the series of CCA annual meetings; seventy-four participants attended this years meeting and twenty-seven talks were presented. The CCA conference series promotes the study and advancement of the theory of computability and complexity over real-valued data and its application.

We thank the authors for their contributions to this special issue and the referees for their thorough and diligent work. Finally, we would like to thank Professor Andrea Sorbi of the University of Siena for help in organizing the conference and Professor Hermann Maurer, the managing editor of J.UCS, for his support.
